INTRODUCTION

WHAT IS THE PATENTSCOPE SEARCH SYSTEM?

You're a patent attorney and need to find a specific patent document...

You're an inventor and want to see whether your latest invention has already been patented...

You're a researcher and are interested in seeing which technologies have been developed in your field...

You're an entrepreneur and want to find out who your competitors are and what they're up to...

The PATENTSCOPE search system just might be the right tool for you!

The PATENTSCOPE search system is the FREE OF CHARGE patent search system provided by the World Intellectual Property Organization (WIPO) that allows you to access millions of patent documents and non-patent literature.

This User's Guide will help you get to know the PATENTSCOPE search system and learn how to get the most out of its powerful search and analysis features.

ABOUT THIS GUIDE

The PATENTSCOPE search system is constantly improving to provide new features and new content to its users. In fact, from the time the writing of this guide started to the time it was completed, a few things have changed on the interface. To keep up to date on the latest developments and changes to the PATENTSCOPE search system, look at:

<https://www.wipo.int/patentscope/en/news/>

To help readability, a few conventions were used in this guide:

- [Web Sites URLs](#) and [email addresses](#) are in blue in Courier; and
- to refer to *something that you see on the interface* italics was used;
- tips are indicated with 

Note: Screenshots in this guide reflect what the interface was like in December 2023; a few significant changes took place during the writing of this guide.

WHAT IS THE DATA COVERAGE?

PATENTSCOPE gives you access to millions of patent documents and non-patent literature, namely:

- International Patent Applications filed under the PCT (Patent Cooperation Treaty)
- Regional and national patent collections from numerous participating countries and organizations, including:

- Argentina
- ARIPO (African Regional Intellectual Property Organization)
- Australia
- Austria
- Bahrain
- Belgium
- Brazil
- Brunei Darussalam
- Bulgaria
- Cambodia
- Canada
- Chile
- China
- Colombia
- Costa Rica
- Cuba
- Czech Republic
- Czechoslovakia
- Denmark
- Dominican Republic
- EAPO (Eurasian Patent Organization)
- Ecuador
- Egypt
- El Salvador
- EPO (European Patent Office)
- Estonia
- Finland
- France
- Georgia
- Germany
- Germany (DDR data)
- Greece
- Guatemala
- Honduras
- India
- Indonesia
- Israel
- Italy
- Japan
- Jordan
- Kazakhstan
- Kenya
- Lao People's Democratic Republic
- Latvia
- Lithuania
- Malaysia
- Malta
- Mexico
- Monaco
- Morocco
- Netherlands
- New Zealand
- Nicaragua
- Norway
- Panama
- Peru
- Philippines
- Poland
- Portugal
- Republic of Korea
- Romania
- Russian Federation
- Russian Federation (USSR data)
- Saudi Arabia
- Serbia
- Singapore
- Slovakia
- South Africa
- Spain
- Sweden
- Switzerland
- Thailand
- Tunisia
- United Arab Emirates
- United Kingdom
- United States of America
- Uruguay
- Vietnam

WHAT IS THE DATA COVERAGE?

Those countries share their national/regional data with WIPO; they are not the PCT applications entering into national phase into those countries. National phase information is available here:

https://patentscope.wipo.int/search/en/help/national_phase_entry.jsf

Please check our website, new collections become available on a regular basis. The collections available are listed in the *Simple Search/Advanced Search/Field Combination* page; click the arrow sign next to *Offices* to see the list.

PATENTSCOPE Simple Search

Using PATENTSCOPE you can search 114 million patent documents including 4.7 million published international patent applications (PCT). [Detailed coverage information](#)
PCT publication 49/2023 (07.12.2023) is now available [here](#). The next PCT publication 50/2023 is scheduled for 14.12.2023. [More](#)
Check out the [latest PATENTSCOPE news and features](#)
PATENTSCOPE Live Chat : every Monday from 1:00 PM to 5:00 PM CET

UP-TO-DATE & DETAILED DATA COVERAGE

For the most up-to-date information on data coverage, please go to the *Help* menu, *PATENTSCOPE Help, Data coverage national collections* at:

https://patentscope.wipo.int/search/en/help/data_coverage.jsf

WHAT IS THE DATA COVERAGE?

NON-PATENT LITERATURE

The integration of non-patent literature (NPL) in PATENTSCOPE has open-access content from IEEE, Nature, Wikipedia (only technology and scientific content filtered using an in-house algorithm) and MDPI.

A new button to include the NPL in the result list is now available in:

- 1. The *Advanced Search* and the *Field Combination* interfaces

If selected, the result list will include NPL information ranked by relevance together with the patent documents that match the search performed.

An example of an NPL document:

3. NPL332026745 - HOST PREFERENCE AND INVASIVENESS OF COMMENSAL BACTERIA IN THE *LOTUS* AND *ARABIDOPSIS* ROOT MICROBIOTA

NPL Biblio. Data Description Citations

PermaLink Machine translation

Publisher nature Journal Nature Microbiology Publication Number 10.1038/s41564-021-00941-9 Publication Date 01.09.2021 IPC C12N 1/20 C12Q 1/6895 A01N 63/02 A01N 63/00 C12R 1/01 Authors Kathrin Wippl Department of Plant-Microbe Interactions, Max Planck Institute for Plant Breeding Research, Cologne, Germany Ke Tao Department of Molecular Biology and Genetics, Faculty of Science and Technology Aarhus University, Aarhus, Denmark	Title [EN] Host preference and invasiveness of commensal bacteria in the <i>Lotus</i> and <i>Arabidopsis</i> root microbiota Abstract [EN] Roots of different plant species are colonized by bacterial communities, that are distinct even when hosts share the same habitat. It remains unclear to what extent the host actively selects these communities and whether commensals are adapted to a specific plant species. To address this question, we assembled a sequence-indexed bacterial culture collection from roots and nodules of <i>Lotus japonicus</i> that contains representatives of most species previously identified using metagenomics. We analysed taxonomically paired synthetic communities from <i>L. japonicus</i> and <i>Arabidopsis thaliana</i> in a multi-species gnotobiotic system and detected signatures of host preference among commensal bacteria in a community context, but not in mono-associations. Sequential inoculation experiments revealed priority effects during root microbiota assembly, where established communities are resilient to invasion by latecomers, and that host preference of commensal bacteria confers a competitive advantage in their cognate host. Our findings show that host preference in commensal bacteria from diverse taxonomic groups is associated with their invasiveness into standing root-associated communities. WHAT IS THE DATA COVERAGE?

NON-PATENT LITERATURE

The information in the *NPL Biblio. Data* tab is available for download for logged-in users. The link to the source allows users to export the content.

In the *Description* tab, the full-text of the article is available and the *Machine translation* button is available if translation is needed:

The screenshot displays the patent record for NPL332026745, titled "3. NPL332026745 - HOST PREFERENCE AND INVASIVENESS OF COMMENSAL BACTERIA IN THE LOTUS AND ARABIDOPSIS ROOT MICROBIOTA". The interface includes tabs for "NPL Biblio. Data", "Description", and "Citations", with "Description" currently selected. A "PermaLink" button and a "Machine translation" dropdown menu (highlighted with a red box) are located in the top right corner. The main content area contains a note about the source, a Creative Commons Attribution 4.0 International License (CC BY 4.0), and the start of the abstract in English. The abstract discusses the colonization of plant roots by bacterial communities and the effects of host preference on commensal bacteria. The section is titled "Main" and continues with further details about the root microbiota and its functions.

[EN]

Roots of different plant species are colonized by bacterial communities, that are distinct even when hosts share the same habitat. It remains unclear to what extent the host actively selects these communities and whether commensals are adapted to a specific plant species. To address this question, we assembled a sequence-indexed bacterial culture collection from roots and nodules of *Lotus japonicus* that contains representatives of most species previously identified using metagenomics. We analysed taxonomically paired synthetic communities from *L. japonicus* and *Arabidopsis thaliana* in a multi-species gnotobiotic system and detected signatures of host preference among commensal bacteria in a community context, but not in mono-associations. Sequential inoculation experiments revealed priority effects during root microbiota assembly, where established communities are resilient to invasion by latecomers, and that host preference of commensal bacteria confers a competitive advantage in their cognate host. Our findings show that host preference in commensal bacteria from diverse taxonomic groups is associated with their invasiveness into standing root-associated communities.

Main

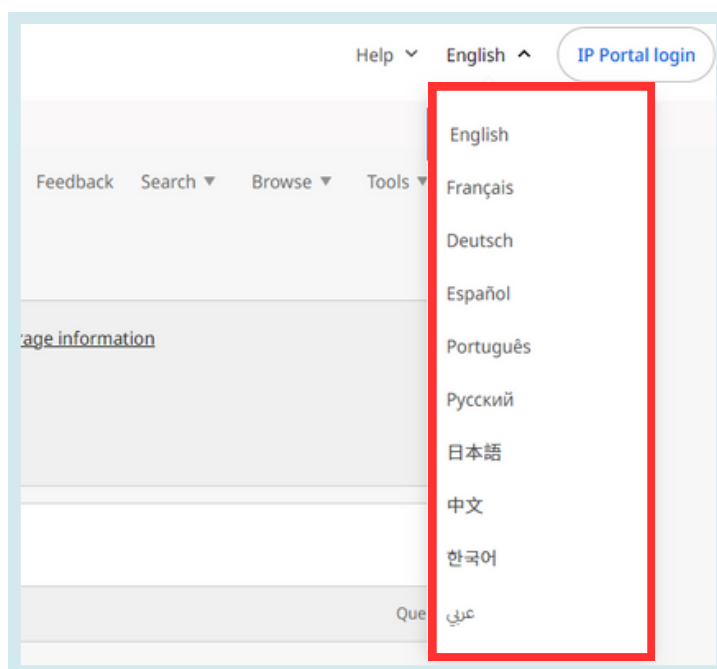

Plant roots associate with diverse microorganisms that are recruited from the surrounding soil biome and that assemble into structured communities known as the root microbiota. These communities provide the host with beneficial functions, such as indirect pathogen protection or mineral nutrient mobilization^{1,2,3}. Despite conservation at higher taxonomic ranks^{4,5,6,7}, comparison of community profiles across diverse land plants shows a clear separation according to host species^{8,9}. These patterns could be explained by a process in which the root microbiota assemble according to niches defined by plant traits that in turn diversify as a result of plant adaptation to their environment. Alternatively, variation of microbiota profiles along the host phylogeny may be at least partially caused by coadaptation between the plant and its associated microbial communities.

SEARCH INTERFACES

DIFFERENT LANGUAGES

INTERFACE LANGUAGES

The search interface is available in 10 languages that can be selected in the navigation bar (white bar on the top of the interface).

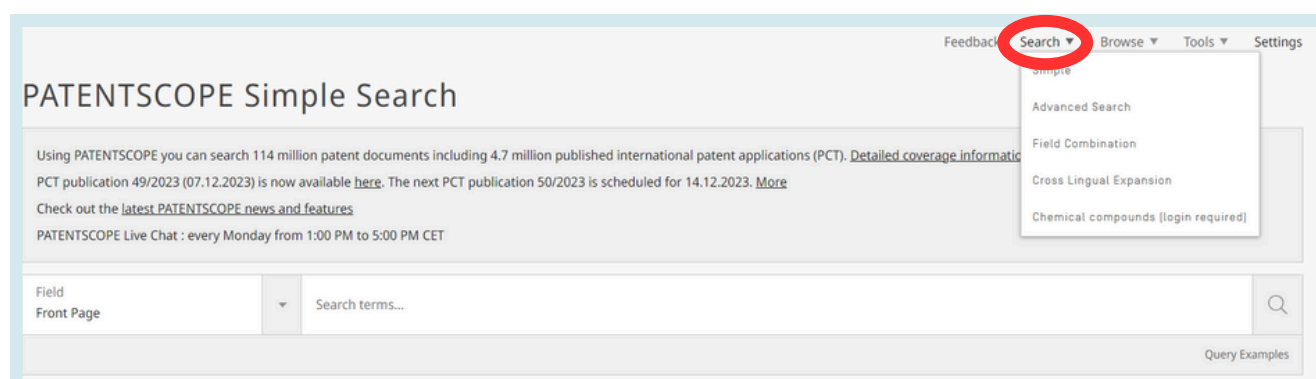

SEARCH LANGUAGES

You can search in all the filing languages of the documents contained in PATENTSCOPE, such as Arabic, Bulgarian, Cambodian, Chinese, Danish, English, Estonian, French, German, Greek, Hebrew, Italian, Japanese, Korean, Laotian, Portuguese, Romanian, Russian, Spanish, Thai, Vietnamese, etc.

SEARCH INTERFACES

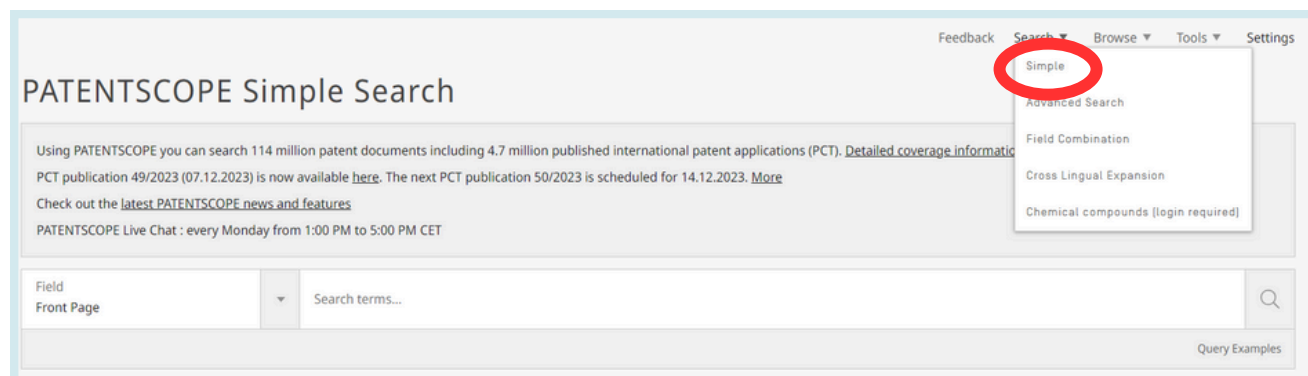

There are 5 ways to conduct a search using PATENTSCOPE Search service. Those options can be selected from the Search menu as indicated below.

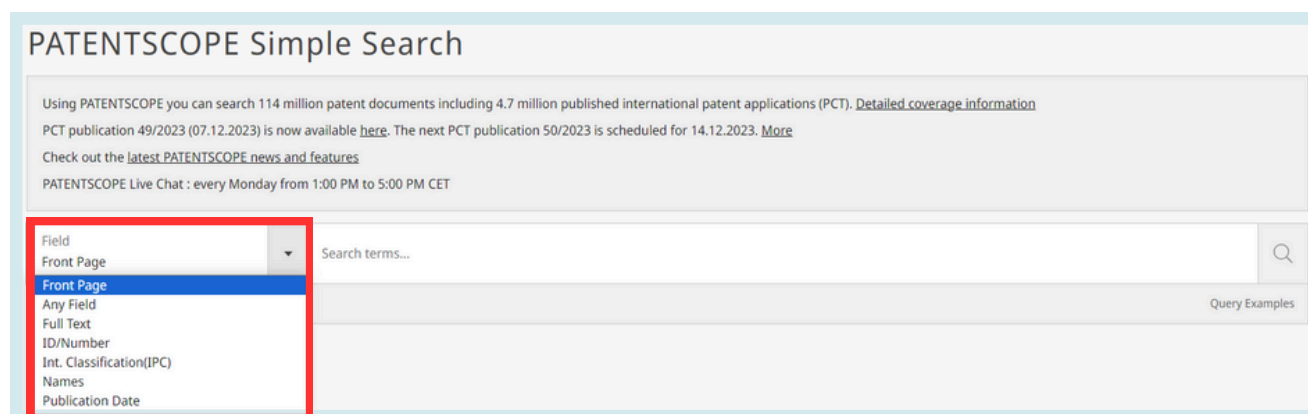

SEARCH INTERFACES

1. SIMPLE SEARCH

The *Simple Search* interface is the default interface.

It offers 7 predefined search fields:

1. *Front page*: the search criteria you entered in this field will be searched in the front page of the document (title, abstract, names and numbers).
2. *Any field*: the search criteria you entered in this field will be searched in any fields of the document.
3. *Full-text*: enter your query in this field if you are interested in full-text.
4. *ID/Number*: enter publication number, filing number, etc.
5. *IPC*: enter any International Patent Classification code.
6. *Names*: enter your search in this field to look for the name of an inventor, an applicant, a company, etc.
7. *Publication Date*: enter a date here to search for specific publication dates.

SEARCH INTERFACES

1. SIMPLE SEARCH

You can use the *Simple Search* interface to search for:

- a specific number: a reference to patent document in the press, in a trial, etc.
- an individual, an inventor, an applicant, etc.
- a company whether it is for personal interest, for merging and/or acquisition purposes or to keep track of the work of a competitor
- an IPC code
- a specific publication date
- a subject matter expressed with simple keywords, a concept that is very specific in order to have a limited number of results

Use the *Browse by week* option under the *Browse* menu to see all international applications published during a given week.

Click the *Query Examples* to be provided with search examples. If you click on those examples, they will automatically appear in the search box. They give you good examples of the kind of searches that can be performed in the *Simple Search* interface:

PATENTSCOPE Simple Search

Using PATENTSCOPE you can search 114 million patent documents including 4.7 million published international patent applications (PCT). [Detailed coverage information](#)
PCT publication 49/2023 (07.12.2023) is now available [here](#). The next PCT publication 50/2023 is scheduled for 14.12.2023. [More](#)

Query Examples

To use the *Simple Search* interface:

1. Select one of the 7 available search fields from the drop-down menu;
2. Enter your search terms into the selected field;
3. Click the  button

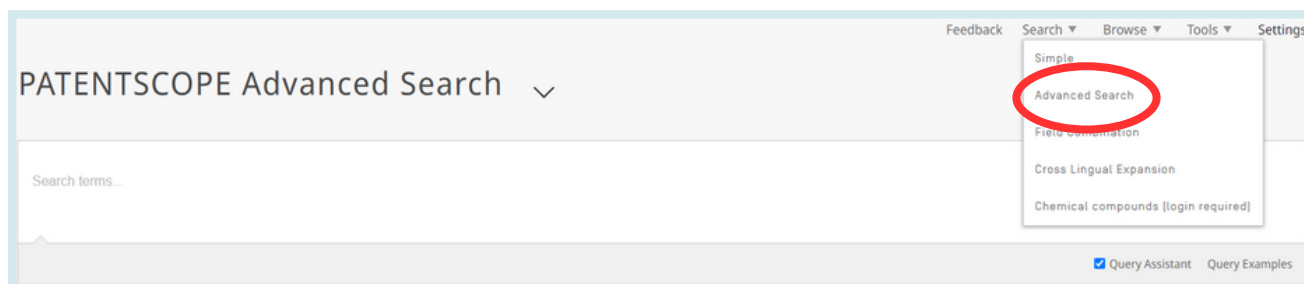

To look for a specific patent document number, use the *ID/Number* field.

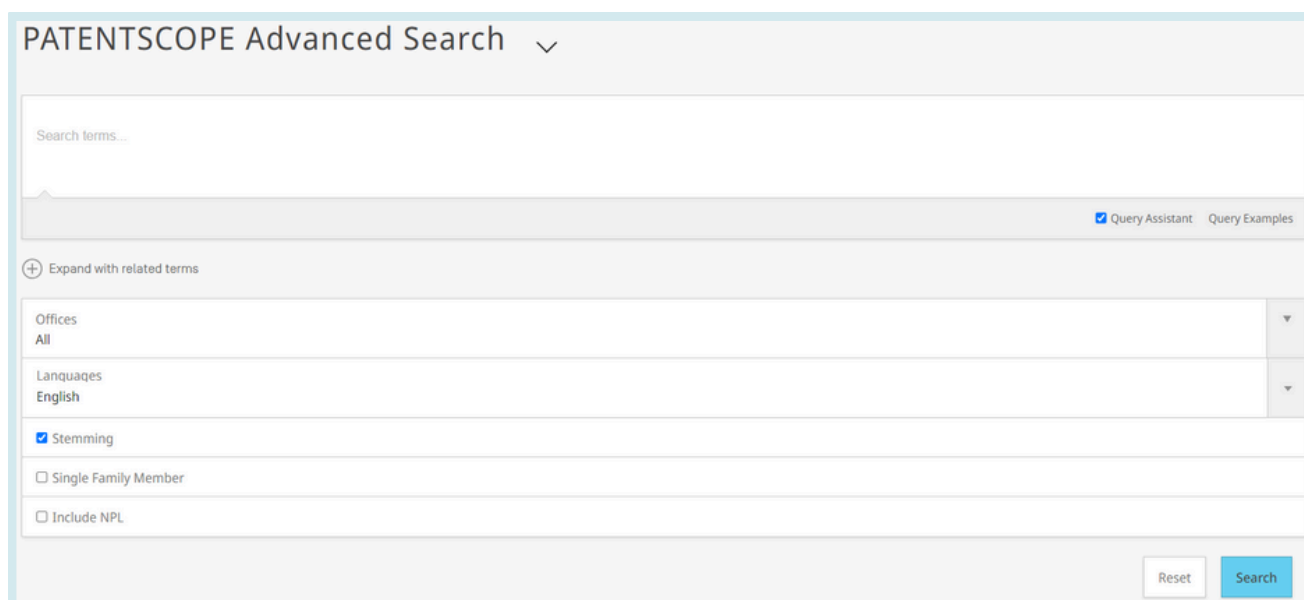

To look for any information related to a name (inventor, agent, etc.), use the *Names* field.

SEARCH INTERFACES

2.ADVANCED SEARCH

The *Advanced Search* is the PATENTSCOPE expert search interface that can be used to create complex search queries using an unlimited number of terms.

The PATENTSCOPE search service offers a wide range of operators that can be used to combine search terms, including Boolean operators, proximity operators, and range operators. Using these operators will allow you to customize your results.

You can also use wildcards:

- 50 wildcards/query max
- 10 wildcards/individual fields (EN_ALLTXT for example) except:
 - EN_ALL, FR_ALL, DE_AL ... 3 wildcards max
 - FR_ALLTXT, DE_ALLTXT... 5 wildcards max
- 2 wildcards/phrase max (EN_TI:"elec* car* veh*")
- No leading wildcard (EN_TI:"*elec")

For more information about operators available in the PATENTSCOPE search service, look at:
<https://patentscope.wipo.int/search/en/help/querySyntaxHelp.jsf>

SEARCH INTERFACES

2.ADVANCED SEARCH

The Advanced Search interface uses field codes to define the fields in which search terms must be found.

More information about field codes can be found at Annex 2 of this guide or at this link:

<https://patentscope.wipo.int/search/en/help/fieldHelp.jsf>

Some examples of the use of the *Advanced Search*:

1. Searching for inventions made by Steve Jobs published during the period from 2007 to 2009 comprising the keyword “touch” in the description.

IN:(Jobs) AND DP:[2007 TO 2009] AND EN_DE:(touch)

This search query uses field codes, a Boolean operator, and a range operator.

The field codes are IN for inventor, DP for publication date, and EN_DE for English description.

The Boolean operator AND is used to ensure that all search terms are included in the search results (i.e. that the results are for Jobs as inventor, within the given publication date range, and using the word “touch”).

The range operator TO is used to define a range of publication date values.

2. Searching for inventions related to cutting tree trunks:

cutting AND trunk

This search query will retrieve over 10,000 results, many of which are not related to cutting tree trunks.

cutting NEAR5 trunk

This search query retrieves a few hundred results; most of which are related to the wood industry. It uses a proximity operator NEAR to ensure that the two terms are close to each other in your results and specifies that they must be within 5 words of each other by defining the value as NEAR5. Similarly, you could specify that the terms must be within any other number of words of each other, e.g. NEAR4, NEAR100.

3. Searching for surgical instruments that are referred to before the paragraph “Field of the invention”:

“Field of the invention” BEFORE100 “surgical instruments”

The operator BEFORE allows users to define the part of the document the search should be carried out: only documents containing surgical instruments positioned 100 words after “Field of the invention” will be retrieved.

SEARCH INTERFACES

2.ADVANCED SEARCH

To use the *Advanced Search* interface:

The screenshot shows the PATENTSCOPE Advanced Search interface. At the top is a header bar with the text 'PATENTSCOPE Advanced Search' and a dropdown arrow. Below this is a large search input field labeled 'Search terms...' with a red number '1' next to it. To the right of the input field are two links: 'Query Assistant' and 'Query Examples'. Below the input field is a section titled 'Expand with related terms' with a plus icon. This section contains several filter options: 'Offices' with a dropdown menu showing 'All' and a red number '2'; 'Languages' with a dropdown menu showing 'English' and a red number '3'; a checked checkbox for 'Stemming' with a red number '4'; an unchecked checkbox for 'Single Family Member' with a red number '5'; and an unchecked checkbox for 'Include NPL' with a red number '6'. At the bottom right of the interface are two buttons: 'Reset' and 'Search'.

1. Enter keywords/Boolean expression/field codes etc. Please read the Annex section of this guide or go to the *Help* menu on the search interface for a complete list of Boolean expressions and *Fields Definition*;
2. Select the collection(s) you are interested in using the arrow;
3. Select the language in which you would like to perform the search using the arrow;
4. *Stemming* is on by default. It is a process that removes ending in order to find keywords with common roots such as electric, electricity, electrical. The stemmer is related to the language of the search, in this example, it is therefore the English stemmer.
5. Tick this box if you would like to have family information in your result list. Please read the section in this Guide about families in PATENTSCOPE.
6. Tick this box if you would like to have non-patent literature information in your result list. Please read the section in this Guide about non-patent literature in PATENTSCOPE.

(("automatic piloting" OR "automatic steering" OR "automatic driving" OR autopilot))

Then click the *Expanded Search* button to run your search.

Click the *Query Examples* to be provided with search examples. If you click on those examples, they will automatically appear in the search box.

SEARCH INTERFACES

3.FIELD COMBINATION

The *Field Combination* interface can be used to structure a more targeted search using specific search criteria in any search fields (e.g., title, abstract, description, etc.) can be performed using this interface.

 A screenshot of the PATENTSCOPE Field Combination interface. The top navigation bar includes 'Feedback', 'Search', 'Browse', 'Tools', and 'Settings'. The 'Search' dropdown menu is open, showing options: 'Simple', 'Advanced Search', 'Field Combination' (highlighted with a red circle), 'Cross Lingual Expansion', and 'Chemical compounds [login required]'. Below the menu, the interface shows a table with search fields and operators. The first row has 'Field Front Page' and 'Value'. The second row has 'Operator AND', 'Field WIPO Publication Number', and 'Value'. The third row has 'Operator AND', 'Field Application Number', and 'Value'. The fourth row has 'Operator AND', 'Field Publication Date', and 'Value'. The fifth row has 'Operator AND', 'Field English Title', and 'Value'. The sixth row has 'Operator AND', 'Field All Classifications', and 'Is Empty: N/A'. The seventh row has 'Operator AND', 'Field Licensing availability', and a checkbox. Below the table, there are buttons for 'Add another search field' and 'Reset search fields'. At the bottom, there are sections for 'Offices' (All), 'Languages' (English), 'Stemming' (checked), 'Single Family Member' (unchecked), and 'Include NPL' (unchecked). There are 'Reset' and 'Search' buttons at the bottom right.

The *Field Combination* Search, a list of preset search fields that can be combined according to the users' needs, should be used to search together different concepts such as:

- a date and an inventor
- an inventor and a company,
- etc.

Any combination of the preset search fields available in the *Field Combination* Search is possible.

SEARCH INTERFACES

3.FIELD COMBINATION

Some examples of the use of the *Field Combination*:

- Searching for the inventions filed by Shimano in 2017.

In the drop-down box, select the field *Applicant Name* and enter Shimano; select *AND* and the field *Publication date* and enter 2017.

PATENTSCOPE Field Combination ▾

	Field		Value	
	Front Page	▼		?
Operator AND	Applicant Name	▼	Shimano	?
Operator AND	Publication Date	▼	2017	?

- Searching for applications containing microchip with licensing availability.

In the drop-down box, select *English Claims* and enter microchip, then tick the *Licensing availability* box (the last row in the Field Combination interface).

Operator AND	Field English Claims	▼	Value microchip	?
Operator AND	Field All Classifications	▼	Is Empty: N/A	▼
Operator AND	Field Licensing availability	▼	<input checked="" type="checkbox"/>	

- Searching for missing information using the empty field option.

For example, you can search applications without any IPC code. In the row before last, select the *IPC* in the drop-down box and tick *yes* next to empty.

Operator AND	Field International Class	▼	Is Empty: Yes	▼
			N/A	
Operator AND	Field Licensing availability	▼	Yes	
			No	

SEARCH INTERFACES

3.FIELD COMBINATION

The screenshot shows the 'PATENTSCOPE Field Combination' interface. It features a table with columns for 'Operator', 'Field', and 'Value'. The first row has 'Front Page' selected in the 'Field' column. Below the table, there are buttons for 'Add another search field' and 'Reset search fields'. Further down, there are sections for 'Offices' (set to 'All'), 'Languages' (set to 'English'), and checkboxes for 'Stemming' (checked), 'Single Family Member', and 'Include NPL'. At the bottom right, the number of results is displayed as '559,410 results', along with 'Reset' and 'Search' buttons. Red circles and numbers 1 through 9 highlight specific elements: 1 points to the 'Field' dropdown arrow, 2 to the 'Operator' dropdown arrow, 3 to the 'Add another search field' button, 4 to the 'Offices' dropdown arrow, 5 to the 'Languages' dropdown arrow, 6 to the 'Stemming' checkbox, 7 to the 'Single Family Member' checkbox, 8 to the 'Include NPL' checkbox, and 9 to the '559,410 results' text.

To use the *Field Combination* interface:

1. Select the field(s) of interest using the arrow of the drop-down menu;
2. Use the *AND/OR* boxes to add or include fields;
3. If you would like to add more fields or remove one or more fields, please click the + or – signs;
4. Select the collection/s you are interested in the drop-down menu;
5. Select the language in which you would like to perform the search in the drop-down;
6. *Stemming* is on by default. It is a process that removing ending in order to find keywords with common roots such as electric, electricity, electrical. The stemmer is related to the language of the search, in this example, it is therefore the English stemmer;
7. Tick this box if you would like to have family information in your result list. Please read the section in this Guide about the families;
8. Tick this box if you would like to have non-patent literature in your result list. Please read the section in this Guide about non-patent literature;
9. At the bottom of the search page, the number of results are indicated, allowing therefor to amend the query is necessary.

From the result page, to go back to *Field Combination* with your search criteria, go to the *Search* menu and select *Field Combination*.

SEARCH INTERFACES

4. CLIR (CROSS-LINGUAL INFORMATION RETRIEVAL)

The screenshot shows the PATENTSCOPE Cross Lingual Expansion search interface. At the top, there is a search bar labeled 'Search terms... *'. To the right of the search bar is a dropdown menu with the following options: 'Simple', 'Advanced Search', 'Field Combination', 'Cross Lingual Expansion' (highlighted with a red circle), and 'Chemical compounds (login required)'. Below the search bar, there are three main sections: 'Query Language' (set to 'English'), 'Expansion Mode' (with 'Automatic' selected and 'Supervised' as an option), and 'Precision level' (set to 'High'). The 'Supervised' mode section includes a note: 'Use the **Supervised** mode to select the technical domains, the relevant variants, the languages to translate your query to and the fields to search by'. The 'Precision level' section includes a note: 'Influences the precision of the suggested variants. **Highest** level considers only the most relevant ones (less suggested variants). **Lowest** level considers the less relevant as well (more suggested variants)'. A 'Search' button is located at the bottom right of the interface.

CLIR stands for Cross Lingual Information Retrieval. This tool allows you to expand your search by including patent documents in your result list that were disclosed in a foreign language: for example, you enter one keyword in English, your result list will include that keyword in English and its synonyms as well as the translation of both the keyword and the synonyms into 13 languages. The tool first finds synonym of your query and then translate everything into 13 languages. The following languages are available:

- Chinese
- Danish
- Dutch
- English
- French
- German
- Italian
- Japanese
- Korean
- Polish
- Portuguese
- Russian
- Spanish
- Swedish

Just enter one or more terms in one of those languages in the search box and the system will suggest variants and translate the term(s), thus allowing you to search patent documents disclosed in all of these languages.

SEARCH INTERFACES

4. CLIR (CROSS-LINGUAL INFORMATION RETRIEVAL)

The screenshot shows the 'PATENTSCOPE Cross Lingual Expansion' interface. It features a search box at the top (1). Below it are three main sections: 'Query Language' (2) with a dropdown menu, 'Expansion Mode' (3) with radio buttons for 'Automatic' and 'Supervised', and 'Precision level' (4) with a dropdown menu. A 'Search' button (5) is located at the bottom right. The 'Supervised' mode section includes a note about selecting technical domains and relevant variants.

To use the CLIR interface:

1. Enter the search query in the search box. Up to 5 keywords can be entered and “...” are supported.
2. Select the language of your query.
3. Select the *Expansion* mode:
 - *Automatic* will generate the results immediately without any further user input.
 - *Supervised* will allow you to select the technical domain associated with your query and the variants relevant to your query.
4. Select the level of precision. If you favor precision, an expanded query will be built in order to retrieve only the most relevant results at the risk of missing some results. If you favor recall, an expanded query will be built in order to retrieve more results at the possible expense of accuracy.
 - *Precision* is defined as the proportion of relevant documents in the set of all documents returned by a search query. Precision is a measure of exactness.
 - *Recall* is defined as the number of relevant documents retrieved as fraction of all relevant documents. Recall is a measure of completeness.
5. Click the *Search* (automatic mode) or *Select Domains* (supervised mode) button.

AUTOMATIC MODE

After entering your query, select the query language, the expansion mode, define the level of precision and click the *search* button:

This screenshot shows the interface with the query 'biodegradable cup' entered in the search box. The 'Query Language' is set to 'English', 'Expansion Mode' is set to 'Automatic', and 'Precision level' is set to 'High'. The 'Search' button is visible at the bottom right.

SEARCH INTERFACES

4.CLIR (CROSS-LINGUAL INFORMATION RETRIEVAL)

The result list will be displayed with the new query containing synonyms and translations of your query:

Term 2: biodegradable

Start Over Back Translate Selected Terms

Please note that is necessary to check if each displayed variant applies otherwise you might have incomplete results.

Click on *Translate Selected Terms*.

SEARCH INTERFACES

4. CLIR (CROSS-LINGUAL INFORMATION RETRIEVAL)

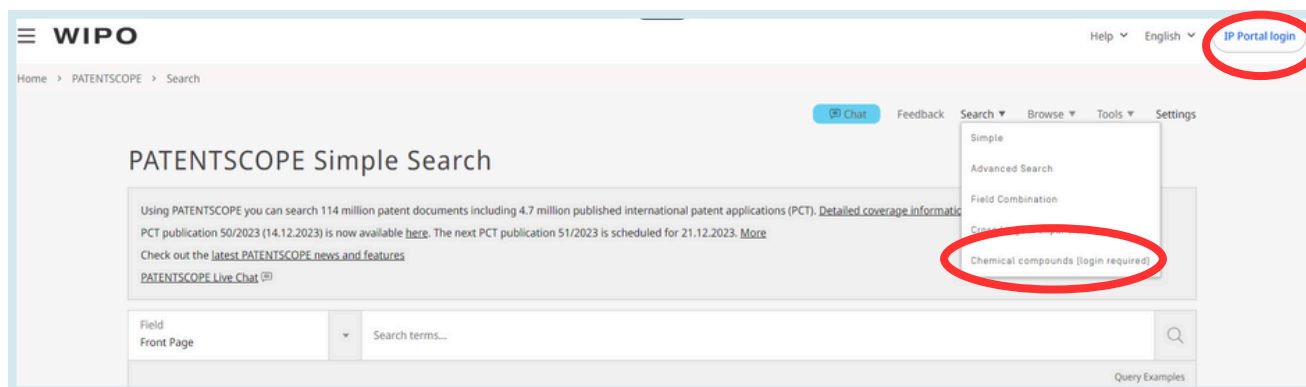

- Step 4: Check the proposed translations and define the fields in which the search should be performed.

1. Check the translated terms by going in each tab. The *remove translation* button will remove language that the user is not interested in
2. Define the fields where the search will be performed. We recommend using title and abstract because it is fast. If you are not satisfied with the amount of results, add then first claims and finally description to the scope of your query to try to find more results.
3. Define the distance between the words. We recommend using the unconstrained option when searching titles and abstracts. If you search description or claims, we recommend using the sentence or paragraph distance to make sure the concepts you search appear close to one another in the text of the returned results.
4. Untick the *Stemming* option if you would like to have results including only the exact term of your search. Stemming uses the root form of the word, for example if you search “swim”, the results will include swimming, swimmers etc.
5. Click on *Submit Query*. Results will be retrieved from the PATENTSCOPE search service and results will be displayed.

SEARCH INTERFACES

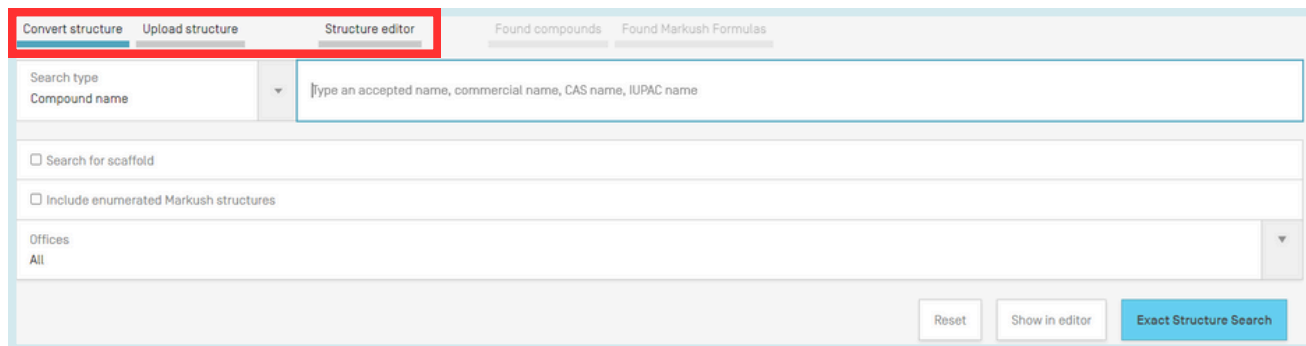

5. CHEMICAL STRUCTURE SEARCH

Available from the *Search* menu, for logged-in users, the chemical structure search allows users to search for chemical information in PATENTSCOPE

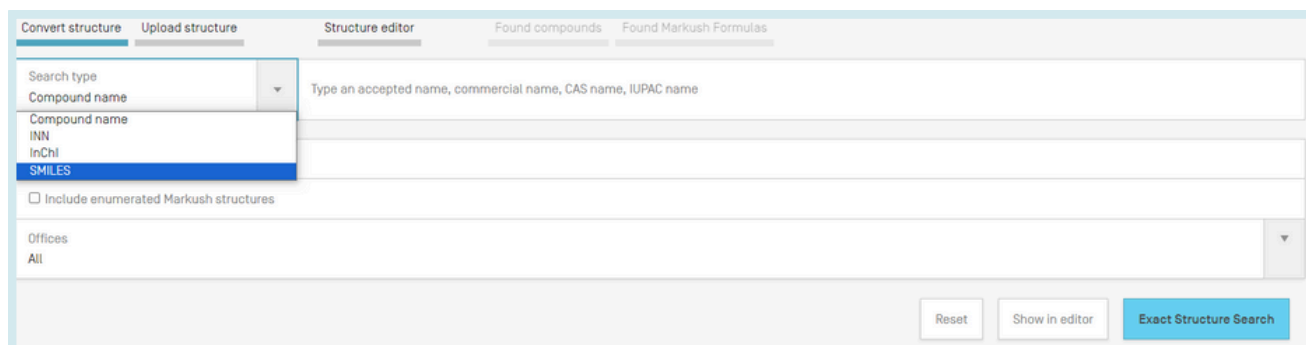

If you do not have a WIPO account to login-in, please see Login section of this Guide menu.

There are three options to perform a search.

CONVERT STRUCTURE TAB

Convert a structure allows users to select the input type of the search such as the name of the chemical compound.

SEARCH INTERFACES

5.CHEMICAL STRUCTURE SEARCH

Different option to enter your search are available: name of the chemical compound such as trivial name, commercial name, IUPAC name or CAS name, the International Nonproprietary Name (INN) InChI, InChIkeys or SMILES.

You can submit your query directly or check the structure using the *show in editor*. This button will process the input data to convert the compound name, INN, InChI or SMILES into the corresponding structure.

STRUCTURE EDITOR TAB

Structure editor allows users to draw or edit a structure. Chemical structures, reactions and fragments can be drawn in a very intuitive way using the symbols familiar from chemical sketches on paper.

To save a chemical structure that you drew in the Editor, first select *Evaluate*, then use the download button available below the drawing pad to download the mol file.

SEARCH INTERFACES

5. CHEMICAL STRUCTURE SEARCH

MARKUSH SEARCH IN PATENTSCOPE

Markush searching refers to finding an exact structure or a substructure or a fuzzy structure of interest in documents with a range of chemical structures defined by a Markush structure.

Within the PATENTSCOPE system there are two ways of carrying out a Markush search.

SEARCH INTERFACES

5. CHEMICAL STRUCTURE SEARCH

1. Firstly, in order to enable a rapid search within structures contained in documents defined by a Markush formula, these Markush structures have been enumerated and the relevant document annotated with the respective InchiKeys in the same way as for the normal chemical structures in PATENTSCOPE documents which have been identified as chemical related.

This function is available in the *Chemical Compounds Search* opening page by selecting the *Include enumerated Markush structures* function and by clicking on the *Exact Structure Search* button:

PATENTSCOPE Chemical compounds search

Convert structure Upload structure Structure editor Found compounds Found Markush Formulas

Search type

SEARCH INTERFACES

5.CHEMICAL STRUCTURE SEARCH

The advantages of the Markush search by enumerations are:

1. Simplicity: you only need to tick a box to search Markush Formulae
2. Response times: the search is executed in a matter of seconds
3. Full power of combination with all other PATENTSCOPE fields using Boolean logic: for example if you want to search cimetidine in Markush structures but only documents concerning Mandelson syndrome, you could use the search query: "ENUM: (AQIXAKUUQRKLN- UHFFFAOYSA-N) AND EN_DE:Mandelson"

The disadvantages are:

1. Reduced recall: the Markush enumeration algorithm enumerates each Markush formula to a maximum number of 500 Inchikeys, starting with the simpler structures that match the Markush definition. The more complicated structures will not be retrieved.
2. Only exact compound searches can be conducted

2. Secondly, another more elaborate search is available from the *structure editor* page. To arrive at this page when you are using a name, or chemical formula as your input, firstly, type in your search term and then click the *Show in editor* button as shown below:

PATENTSCOPE Chemical compounds search

Convert structure Upload structure Structure editor Found compounds Found Markush Formulas

Search type
Compound name

Type an accepted name, commercial name, CAS name, IUPAC name
lansoprazole

☐ Search for scaffold

☐ Include enumerated Markush structures

Offices
All

Reset Show in editor Exact Structure Search

In this case the search term is lansoprazole and when the structure editor opens you need to scroll down to beneath the structure window and a tab with the option of *Markush Search* is visible which gives the option of two different search types, see below:

SEARCH INTERFACES

5. CHEMICAL STRUCTURE SEARCH

Convert structure Upload structure Structure editor Found compounds Found Markush Formulas

Reset Markush Search Substructure Search Exact Structure Search Evaluate

Substructure Search
Exact Search

This search uses a manually-curated database where the structures are represented as chemical MOL files and the search uses a complex chemical matching algorithm.

You can specify the matching algorithm you want to be applied between your search structure and the Markush formulae indexed in the system:

- exact match
- substructure match

This more complex search technique takes longer and once the first illustrative results are displayed there is the option of a *batch* search in which your search will carry on in the background and your results will be available in your PATENTSCOPE account a while later.

Clicking on the *show more* link allows to search interactively for more matches for one more minute and the percentage of the indexed Markush structures that have been searched so far increases accordingly:

SEARCH INTERFACES

5. CHEMICAL STRUCTURE SEARCH

Markush structures are identified by their unique number, attributed by Clarivate Analytics (Here: 9117-08201, 9138-09401,...)

When you are satisfied with the found Markush structures (or have searched them all), the next step is to search for the corresponding patent documents. This is done by selecting the displayed Markush structures of interest up to a maximum of one thousand (you can click on the *select all* button if applicable) and then click on the *Search* button.

And finally you get the PATENTSCOPE results list:

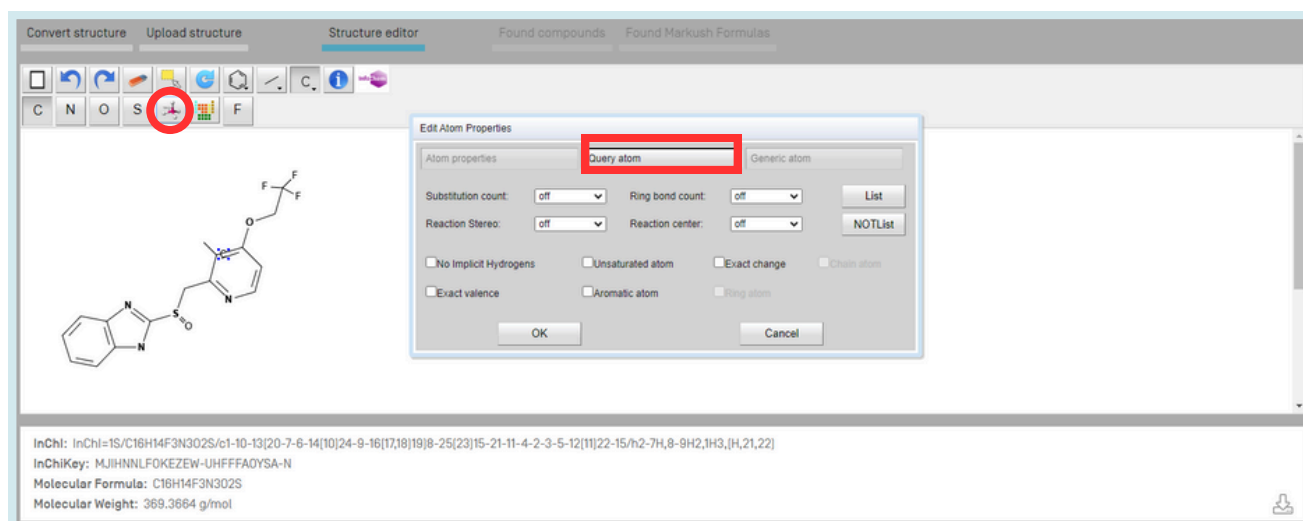

The MN search field also allows you to search directly if you already have one or more Clarivate Markush numbers to search.

SEARCH INTERFACES

5. CHEMICAL STRUCTURE SEARCH

Please note:

1. The search by matching structures implemented in PATENTSCOPE has a limitation in the sense that all repeating groups in the indexed Markush structures are standardized to one repetition ie. in a chemical structure with $-(CH_2)_n-$ only $n=1$ will be found. As a consequence, you may need to manually edit your searched structures if it contains similar repeating groups.
2. There is the capacity to define variable groups for your searched structure in the structure editor. This is achieved by using the pre-defined groups to change an atom properties by firstly drawing a skeleton, selecting the atom properties where you wish to place the pre-defined group using the highlighted button in the image below, selecting the *query atom* button where you have the choice of pre-defined groups to take the place of the selected atom:

Markush searching using the matching algorithms has the following advantages:

- Recall: all structures matching a given Markush structure can be searched (not only the 500 simplest ones as for the enumerated structures)
- Richness of what to search: Markush structures can not only be searched for exact compounds but also for compounds with specified variable groups
- Richness of how to search: three levels of matching algorithms are provided with increasing recall and decreasing precision: exact, substructure, fuzzy substructure which automatically introduces the variable groups as above in the query atom tab

And the following disadvantages:

- Very long response times
- Repeating groups not supported
- Complexity: chemical knowledge required to select the found Markush structures of interest

SEARCH INTERFACES

5. CHEMICAL STRUCTURE SEARCH

To conclude, when viewing the search result record details of a patent document, a new tab has been defined to display the associated Markush structures and enumerations:

1. EP0423748 - STABILIZED PHARMACEUTICAL COMPOSITION AND ITS PRODUCTION.

National Biblio. Data Description Claims Patent Family Compounds **Markush** Documents

Markush Nr. 9117-06201

FAMILIES IN PATENTSCOPE

DEFINITION

PATENTSCOPE Patent Families denominate the grouping of different publications of the same invention by different authorities.

The PATENTSCOPE Patent Families include patent documents via the PCT route and the Paris route.

The PCT families are a subset of the PATENTSCOPE Patent Families. They include:

- A PCT patent application (IC1);
- Its national entries either
 - reported as national entries by the participating offices prior to their publication (IC2 or IC3) or
 - after publication as part of the bibliographic data, International Convention data other than Paris Convention (IC2); and
- Its priority application if first and only priority (IC5);

The PCT families can further be enriched by adding:

- US related documents of US patents already part of the PCT family such as the divisionals, continuations, reissues and republications of those publications. Continuations in part are not included; and finally
- Any applications that have not followed the PCT route but share the same priorities as the members of the PCT family.

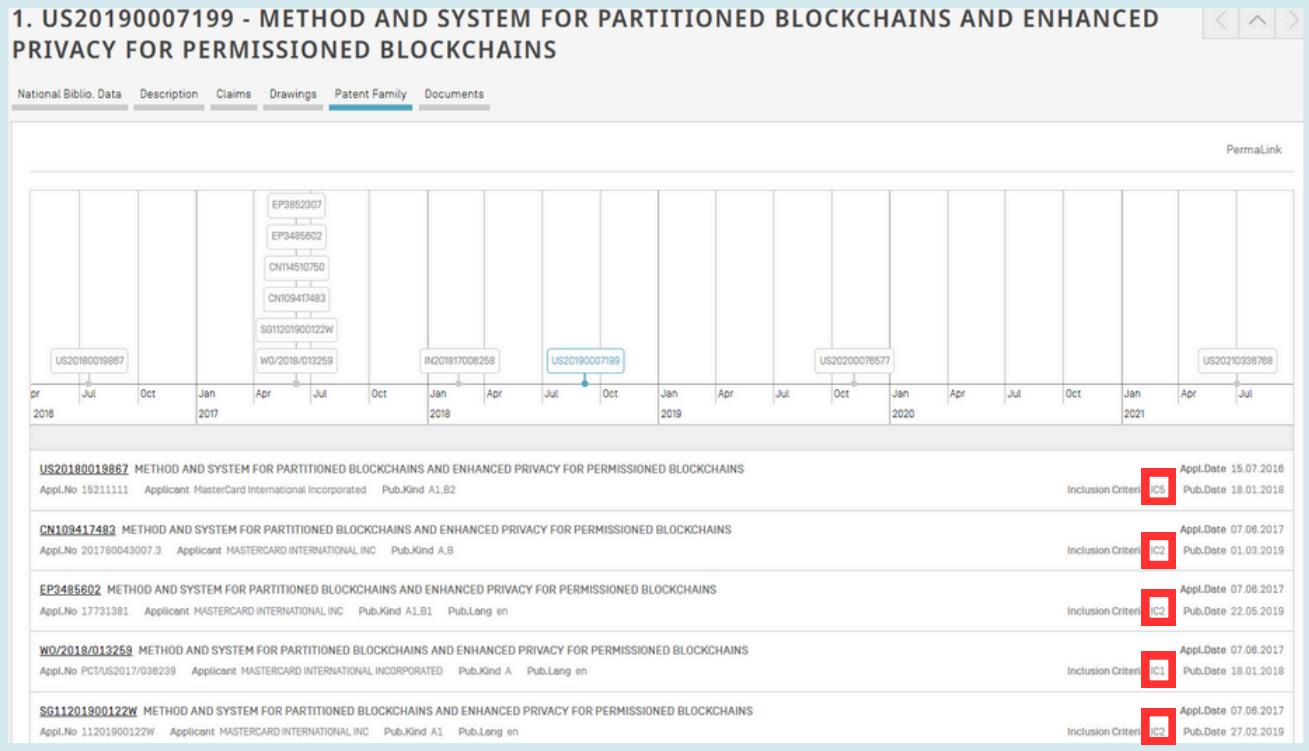

Further to this, the Paris route subset of the PATENTSCOPE Patent Families include:

1. All applications that share the same priorities and where there is no PCT application sharing those priorities (IC4); and
2. US related documents of the US patents already part of the PCT family such as the divisionals, continuations, reissues and republications of those publications. Continuations in part are not included (IC6);
3. The priority application if first and only priority;
4. National application related to another application of the same office already included in the family, such as divisionals, continuations, republications etc.

The IC (Inclusion Criteria) codes indicate which of the criteria listed above was first met and used to include the invention in the family. This does not mean that the criteria listed next to the invention is the only criteria met. A national entry for example that is denoted as IC2 meets also IC4 because it shares the priorities with the PCT application and the other IC2 applications. This information can be found below the application date in the family tab of the patent document:

FAMILIES IN PATENTSCOPE

DEFINITION

IC CODES

Codes	Definition
IC1	A published PCT application from which family originated
IC2	A national entry of the published PCT application in PATENTSCOPE. If not visible in National Phase tab, taken from bibliographic data of national document
IC3	A national entry of the published PCT application not available in PATENTSCOPE
IC4	US application related to one of the other US application/s
IC5	Application is the only priority of the applications of this family
IC6	Connected by priority field
IC7	National application related to another application of the same national office already included in the family

Office India	Title [EN] METHOD AND SYSTEM FOR PARTIMETHOD AND SYSTEM FOR PARTITIONED BLOCKCHAINS AND ENHANCED PRIVACY FOR PERMITTED BLOCKCHAINSTIONED BLOCKCHAINS AND ENHANCED PRIVACY FOR PERMITTED BLOCKCHAINS
Application Number 201817006258	Abstract [EN] A method for generation of blocks for a partitioned blockchain includes: storing blocks comprising a partitioned blockchain, wherein each block includes a header and transaction entries; receiving transaction data entries for each of a plurality of subnets; generating a hash value of the header included in the most recently added block; generating a new block header, the new block header including the generated hash value, a timestamp, and a sequence of pairs including a pair for each of the plurality of subnets, each pair including a subnet identifier associated with the respective subnet and a merkle root of each of the transaction data entries received for the respective subnet; generating a new block, the new block including the generated new block header and the transaction data entries for each of the plurality of subnets; and transmitting the new block to a plurality of nodes associated with the partitioned blockchain.
Application Date 19.02.2018	Related patent documents US20180019867 CN109417483 EP3485602 WO/2018/013259 SG11201900122W EP3852307 CN114510750 US20200007857 US20210338768
Publication Number 201817006258	
Publication Date 22.08.2018	

For the Indian documents, the “prior PCT field” in the bibliographic data was used. This “Prior PCT field” is a field not shown in the PATENTSCOPE interface. This information is available in the database provided by the offices and which complements the national phase information.

- IC5: the application that is the sole priority of all members in the family

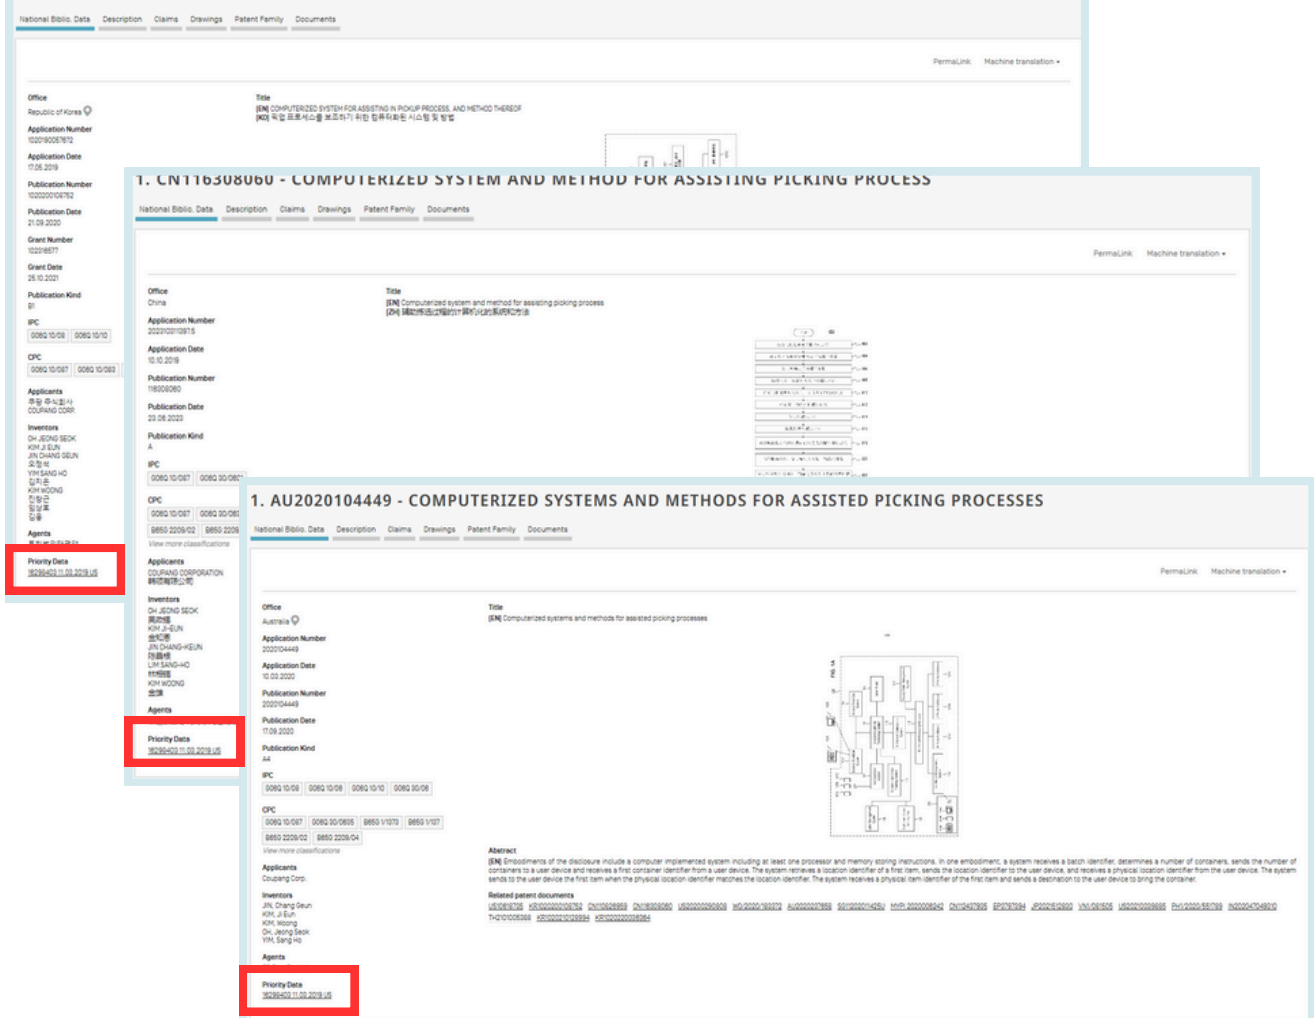

FAMILIES IN PATENTSCOPE

FAMILY INFORMATION ACCESS

- IC6: applications included in the family based on matching priorities

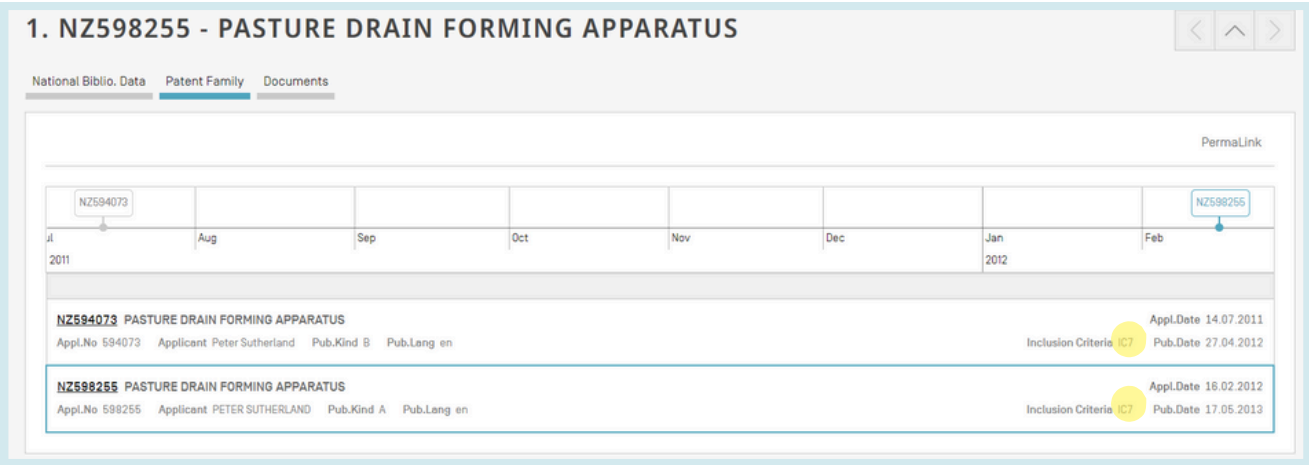

1. KR1020200108752 - COMPUTERIZED SYSTEM FOR ASSISTING IN PICKUP PROCESS, AND METHOD THEREOF

FAMILIES IN PATENTSCOPE

FAMILY INFORMATION ACCESS

- IC7: a national application related to another application of the same national office already included in the family. It indicates the relationships such as divisionals, republications, reissues etc. It can be considered as the equivalent of IC4 for other national offices than the USPTO.

FAMILIES IN PATENTSCOPE

GROUP RESULTS BY FAMILIES

To use the *Single Family Member* option, go to:

1) The result list (also when using the *Simple search* interface) to select the option *Single Family Member* to open the *Refine Options*:

The screenshot shows the 'Refine Options' dialog box. At the top, there is a status bar with '559,424 results', 'Offices all', 'Languages en', 'Stemming true', 'Single Family Member false' (highlighted with a red box), and 'Include NPL false'. The dialog box contains several settings: 'Offices' set to 'All', 'Languages' set to 'English', 'Stemming' checked, 'Single Family Member' unchecked (highlighted with a red box), and 'Include NPL' unchecked. There are 'Close' and 'Search' buttons at the top right.

2) The *Advanced Search* offers the option to select the *Single Family Member* option before the search:

The screenshot shows the 'PATENTSCOPE Advanced Search' interface. It has a search bar at the top. Below it, there are filters: 'Offices' set to 'All', 'Languages' set to 'English', 'Stemming' checked, 'Single Family Member' unchecked (highlighted with a red box), and 'Include NPL' unchecked. There are 'Reset' and 'Search' buttons at the bottom right.

3) The *Field Combination* offers the option to select families before the search:

The screenshot shows the 'Field Combination' interface. It has a search bar at the top. Below it, there are filters: 'Offices' set to 'All', 'Languages' set to 'English', 'Stemming' checked, 'Single Family Member' unchecked (highlighted with a red box), and 'Include NPL' unchecked. There are 'Reset' and 'Search' buttons at the bottom right.

THE CLASSIFICATIONS

INTERNATIONAL PATENT CLASSIFICATION

The International Patent Classification (IPC), established by the Strasbourg Agreement 1971, provides for a hierarchical system of language independent symbols for the classification of patents and utility models according to the different areas of technology to which they pertain. A new version of the IPC enters into force each year on January 1.

SEARCH FIELDS

1. The **IC** field searches International patent classifications. It will look for subgroups, both hierarchically and lexically.

For example,

- searching for A61M16/10 finds the subgroups A61M16/10...A61M16/18
- searching for A61M16/00 finds the subgroups A61M16/00...A61M16/22

The valid formats for an IPC code search are the following:

- IC:A61M
- IC:A61M16 this is equivalent to: IC:"A61M 16"
- IC:A61M16/00 this is equivalent to: IC:"A61M 16/00" or IC:A61M-16/00

Important: You don't have to enter *(wildcard) to find subgroups, they are automatically included.

2. For an exact IPC code search you need to use the **IC_EX**.

- IC_EX:A61M16/00 this is equivalent to: IC_EX:"A61M 16/00" or IC_EX:A61M16/00

You may use a *(wildcard) with the IC_EX field to include similar subgroups.

- IC_EX:A61M*
- IC_EX:A61M16*

Here is the bridge between them IC:A61M16/00 = IC_EX:A61M16*. In practice IC_EX:A61M16* > IC:A61M16/00. On the other hand IC:A61M16/10 > IC_EX:A61M10*

THE CLASSIFICATIONS

COOPERATIVE PATENT CLASSIFICATION

The Cooperative Patent Classification (CPC) system, in force as of 1 January 2013, is a bilateral system that jointly developed by the EPO and the USPTO. It combines the best classification practices of the two offices.

In PATENTSCOPE, the CPC values are imported from DocDB and national offices as follows:

- 59 National offices+PCT: gathered regularly from DocDb and the national offices. PATENTSCOPE contains, at the time of writing this Guide, more than 290 million of CPC entries, which correspond to more than 51 million of distinct filings.
- Daily updates

IP5	N. of distinct filings classified under CPC classification
US	11,538,100
CN	8,875,231
JP	5,337,705
EP	3,777,520
KR	2,058,568

CPC statistics as of February 2020

SEARCH FIELDS

2 search fields are available: CPC, Classif. bClassif is the combination of CPC and IPC.

In the example below, the query: CPC:(Y02A*) returns 1,121,420 results, which are grouped by family.

Countries	Applicants	Inventors	IPC code	CPC code	Publication Dates	Kind code
China	688,986	MONSANTO TECH LLC 2,108	THE INVENTOR HAS WAIVED THE RIGHT TO BE MENTIONED	A61K 157,994	y02a 50/20 225,079	2014 27,166 A 386,676

THE CLASSIFICATIONS

COOPERATIVE PATENT CLASSIFICATION

To search for CPC information, go to the *Field Combination* and select *All Classifications* (combination of IPC and CPC) from the drop-down menus.

PATENTSCOPE Field Combination			
	Field		Value
	Front Page		
Operator AND	All Classifications		
Operator AND	Cooperative Patent Classification		

Those fields can also be found in the *Advanced Search*: just start typing class and the matching fields will appear below:

PATENTSCOPE Advanced Search

Please enter a valid field... (or use UP/DOWN keys, and TAB or ENTER to select)

class

- All Classifications
- File Index classification
- Cooperative Patent Classification
- International Class
- International Class Inventive
- International Class N-Inventive
- Main International Class

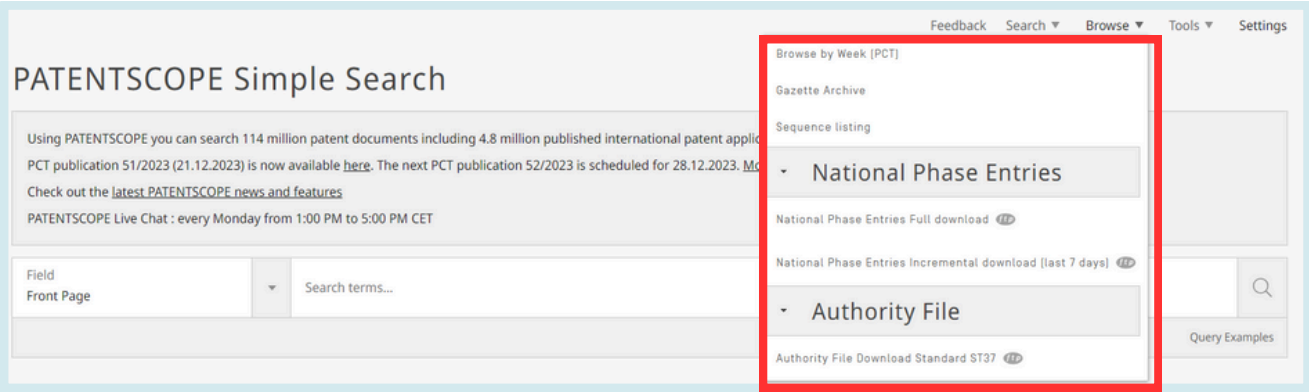

FILE INDEX CLASSIFICATION

The File Index Classification (FI) is Japanese classification systems which enables efficient search of patent documents. It is also noted that FI is based on IPC (International Patent Classification).

In PATENTSCOPE, the available search field is FICLASSIF.

For example, FICLASSIF:("G09G*").

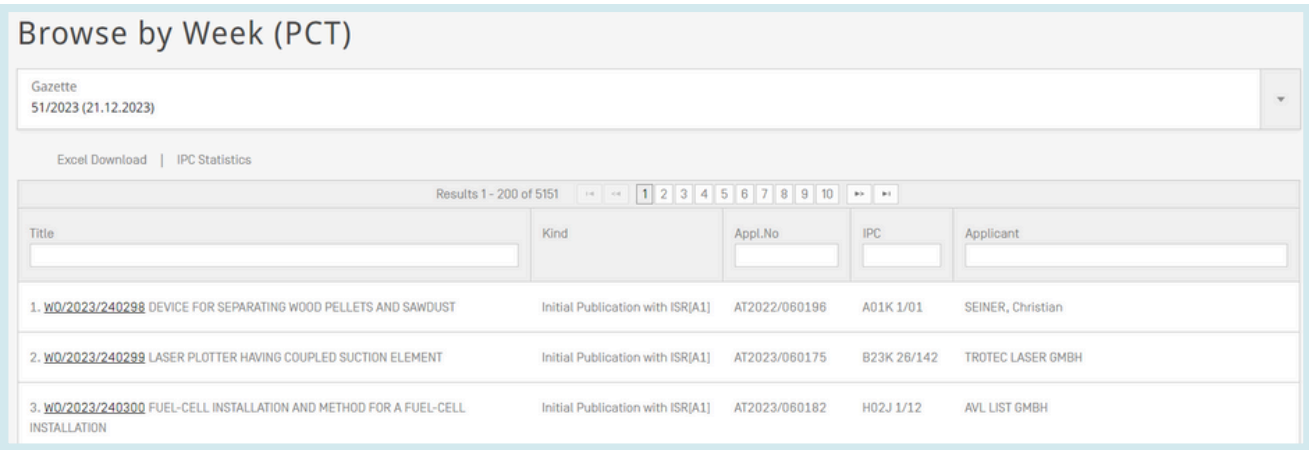

THE BROWSE MENU

BROWSE BY WEEK (PCT)

WIPO publishes new PCT applications every week on Thursday.

Selecting *Browse by week* gives access to a list of PCT applications by publication week.

Use the arrow of the drop-down menu to select a PCT publication week.

The result list can be downloaded using the *Excel download* button and *IPC statistics* can be accessed:

THE BROWSE MENU

BROWSE BY WEEK (PCT)

IPC statistics available in PATENTSCOPE provide a picture of the global trends in PCT applications. For example, it can show who the main and/or new main actors are etc. It takes into account applications that have IPC codes. Out of 3000 published applications, about 100 do not have any IPC code.

IPC Statistics

Columns

Chart	IPC Code	23.11.2023	30.11.2023	07.12.2023	14.12.2023	21.12.2023	Σ Last 5 gazettes	Δ Last gazette	Breakout

- 2003165181 BIODEGRADABLE PAPER CUP** JP - 10.06.2003
Int.Class B32B 27/10 Appl.No 2001368426 Applicant OJI PAPER CO LTD Inventor MIKAMO HIROAKI
PROBLEM TO BE SOLVED: To provide processed paper for a biodegradable paper cup improved in biodegradability, oil resistance, moistureproof properties and water resistance by the use of a hot-melt adhesive and not generating wrinkles in the surface of the outer layer thereof at the time of molding of the paper cup, and the biodegradable paper cup.
SOLUTION: The processed paper for the biodegradable paper cup has layered constitution of inner surface resin layer/paper layer (1)/hot-melt adhesive layer/ paper layer (2). The inner surface resin layer comprises a biodegradable resin, and the hot-melt adhesive layer is constituted of a composition based on the biodegradable resin. The biodegradable paper cup using the same is also disclosed.

- 20200231326 BIODEGRADABLE DRINKING CUP ASSEMBLY** US - 23.07.2020
Int.Class B65D 3/06 Appl.No 18253310 Applicant Jessica Romano Inventor Jessica Romano
A biodegradable drinking cup assembly for serving hot and cold beverages includes a cup that defines an interior space. The cup comprises hemp fiber so that the cup is biodegradable. The cup, in an upright configuration, is configured to position a liquid in the interior space. The cup insulates a hot or cold beverage and is configured for composting after use.
- 111518375 BIODEGRADABLE THERMOFORMED CUP AND PREPARATION METHOD** CN - 11.08.2020
Int.Class C08L 67/04 Appl.No 202010528270.1 Applicant CSIC PRIDE (NANJING) TECHNOLOGY INNOVATION CO., LTD. Inventor LI JIN
The invention discloses a biodegradable thermoformed cup. The biodegradable thermoformed cup comprises the following components in parts by weight: 55 to 75 parts of polylactic acid, 10 to 25 parts of polypropylene carbonate, 1 to 10 parts of cotton fibers, 1 to 10 parts of filler powder, 0.1 to 1 part of paraffin, 0.1 to 1 part of a coupling agent and 0.1 to 0.9 part of a compatilizer. The biodegradable thermoformed cup is easy to form through thermoforming, the cup wall is thinner, high strength is realized, the cup wall is not easy to deform, and the cup is biodegradable and pollution-free. The invention further provides a preparation method of the biodegradable thermoformed cup.

Title
[EN] BIODEGRADABLE CAPSULES
[FR] CAPSULES BIODEGRADABLES

[Fig. 2]

Abstract
[EN] The present invention relates to the field of sealed capsules that are biodegradable by industrial composting and by domestic composting, for single use, containing at least one substance in powder form for the preparation of a beverage, e.g. coffee, intended to be extracted under pressure, said capsule comprising an enclosure with a bottom and a side wall having a circular rim, and a lid welded to the periphery of the rim of the enclosure, characterised in that the bottom, the side wall and the circular rim are formed by injection moulding of at least one formulation comprising: (i) at least one polymer selected from polyhydroxybutyrate, and (ii) at least one ingredient selected from silicates, vitamin E, plasticised plant or animal proteins, or mixtures thereof.
[FR] La présente invention concerne le domaine des capsules fermées biodégradables par un compostage industriel et par un compostage domestique, à usage unique, contenant au moins une substance sous forme de poudre pour la préparation d'une boisson, par exemple du café, prévues pour être extraites sous pression, ladite capsule comportant une enceinte avec un fond et une paroi latérale ayant un rebord circulaire, et un opercule soudé sur le pourtour du rebord de l'enceinte, caractérisée en ce que le fond, la paroi latérale et le rebord circulaire sont formés par moulage par injection d'au moins une formulation comprenant: (i) au moins un polymère choisi parmi les polyhydroxybutyrate, et (ii) au moins un ingrédient choisi parmi les silicates, la vitamine E, les protéines végétales ou animales plastifiées, ou leurs mélanges.

THE TABS

PCT Biblio. Data

Refers generally to the various data appearing on the front page of a patent document or the corresponding applications and may comprise document identification data, domestic filing data, priority data, publication data, classification data, and other concise data relating to the technical content of the document

Description

Clear and concise explanation of known existing technologies related to the new invention and explanation of how this invention could be applied to solve problems not addressed by the existing technologies; specific embodiments of the new technology are also usually given. Integrated machine translation tools allow translation of the document.

Claims

Legal definition of the subject matter which the applicant regards as his invention and for which protection is sought or granted; each claim is a single sentence in a legalistic form that defines an invention and its unique technical features; claims must be clear and concise and fully supported by the description. Integrated machine translation tools allow translation of the document.

Drawings

gives direct access to the drawings of a patent document

notifications of changes after publication

Documents

This service provides access to published PCT international applications and to the latest bibliographic data and documents contained in the files of PCT international applications. Due to changes in the PCT Regulations and to the availability of documents in electronic form, the information available is different depending on the date of filing of the international application. WIPO bears no responsibility for the content of PCT international applications and related documents. The bibliographic data and documents are updated daily and publication of new applications is updated weekly on publication day, i.e., Thursday, unless the International Bureau is closed for a public holiday in which case data is published on Friday.

In the *Settings* menu, in the *Result* tab, the *enable multi document download* can be activated for logged-in users in order to download one or more documents.

Compounds

will show the compounds and their location within the patent document

SEARCH RESULTS

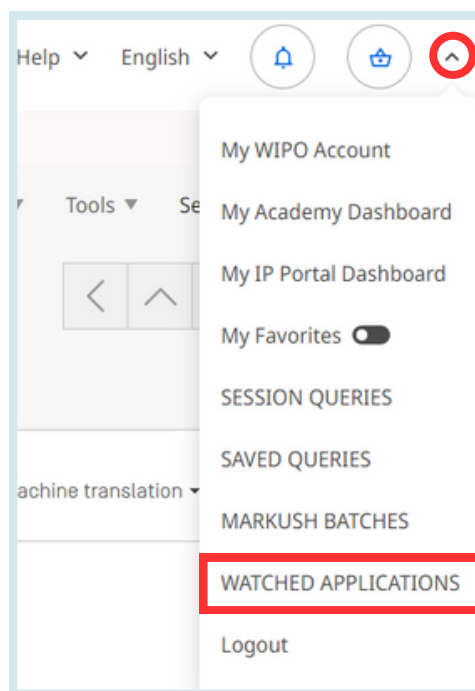

PCT MONITORING

PCT monitoring feature aims to monitor changes of published PCT applications.

To use it, click the *start watching* button available in the *PCT Biblio. Data* tab for PCT applications.

Then go to your WIPO account and click the *watched applications*.

Here you will find the list of the published PCT applications that you are currently monitoring. The maximum number of applications that can be monitored is 20.

If changes occurred in one or more applications, since your last log-in, the application or applications in question will be highlighted. When you are watching one or more applications, each time you open a session, you will have to go to this page, otherwise the potential new highlighting will be gone when you open the next session.

TOOLS

WIPO TRANSLATE

This translation tool is available for the translation of patent texts. Developed and trained internally on bilingual patent corpuses, it incorporates neural machine translation technology. It takes into account 32 technical domains derived from the IPC:

[ADMN] Admin, Business, Management & Soc Sci	[MARI] Marine Engineering
[AERO] Aeronautics & Aerospace Engineering	[MEAS] Standards, Units, Metrology & Testing
[AGRI] Agriculture, Fisheries & Forestry	[MECH] Mechanical Engineering
[AUDV] Audio, Audiovisual, Image & Video Tech	[MEDI] Medical Technology
[AUTO] Automotive & Road Vehicle Engineering	[METL] Metallurgy
[BLDG] Civil Engineering & Building Construction	[MILI] Military Technology
[CHEM] Chemical & Materials Technology	[MINE] Mining, Oil & Gas Extraction & Minerals
[DATA] Computer Sci, Telecom & Broadcasting	[NANO] Nano Technology
[ELEC] Electrical Engineering & Electronics	[PACK] Packaging & Distribution of Goods
[ENGY] Energy, Fuels & Heat Transfer Eng	[PRNT] Printing & Paper
[ENVR] Environmental & Safety Engineering	[RAIL] Railway Engineering
[FOOD] Foods & Food Technology	[SCIE] Optical Engineering
[GENR] Generalities, Language, Media & Info Sci	[SPRT] Sports, Leisure, Tourism & Hospitality
[HOME] Home Contents & Household Maintenance	[TEXT] Textile & Clothing Industries
[HORO] Precision Mechanics, Jewelry & Horology	[TRAN] Transportation
[MANU] Manufacturing & Materials Handling Tech

TOOLS

WIPO TRANSLATE

To use this tool:

- A: Enter your text in the Text to be translated box;
- B: Select the *Language pair*. The system will automatically detect the language pair to be used if you do not select an option;
- C: Select the *Domain*. The system will automatically detect the domain if you do not select an option;
- D: Click the *Translate* button.

The result will appear as shown below:

The tool splits the text into different segments, highlighted in red. For each segment, it suggests alternative translations. The user can also edit the proposed translations.

TOOLS

WIPO PEARL

WIPO's multilingual terminology portal gives access to scientific and technical terms derived from patent documents. It helps promote accurate and consistent use of terms across different languages, and makes it easier to search and share scientific and technical knowledge.

KEY FEATURES

- Developed by WIPO language experts and terminologists.
- 10 languages – Arabic, Chinese, English, French, German, Japanese, Korean, Portuguese, Russian and Spanish.
- All the content has been validated and given a term reliability score.
- If there is no equivalent in the target language in the database, WIPO's machine translation engine may offer you a translation proposal.
- Integrated with PATENTSCOPE so you can search the entire PATENTSCOPE corpus for terms and their equivalents in other languages.

LINGUISTIC SEARCH

Search by term, with optional parameters. Select a *Source Language* for best results, and disable ad-blocking plug-ins.

More information on how to use it available here:

<https://www.wipo.int/reference/en/wipopearl/guide.html>

TOOLS

IPC GREEN INVENTORY

The IPC Green Inventory attempts to collect Environmentally Sound Technologies (ESTs as listed by the United Nations Framework Convention on Climate Change (UNFCCC)) in one place as they are currently scattered widely across the IPC in numerous technical fields.

ESTs are presented in a hierarchical structure (A). For each technology, the links in the IPC column direct the user to the corresponding place in the scheme. The links in the PATENTSCOPE column (B) allow the user to automatically search and display all international patent applications available through PATENTSCOPE that are classified in the relevant IPC place.

IPC Green Inventory

The "IPC Green Inventory", developed by the [IPC Committee of Experts](#), facilitates searches for patent information relating to Environmentally Sound Technologies (ESTs), as listed by the [United Nations Framework Convention on Climate Change \(UNFCCC\)](#). ESTs are currently scattered widely across the IPC in numerous technical fields. The Inventory attempts to collect them in one place.

For more information about how to use the IPC Green Inventory please click [here](#).

The Inventory does not purport to be fully exhaustive in its coverage

TOOLS

SUPPORT COVID-19 EFFORTS

This search functionality aims to facilitate the location and retrieval of information contained in published patent documents that may be useful for innovators developing new technologies to fight the COVID-19 pandemic. It provides an easily accessible source of intelligence for improving the detection, prevention, and treatment of diseases such as the novel coronavirus.

PATENTSCOPE COVID-19 INDEX

The WIPO COVID-19 Search Facility of PATENTSCOPE will provide scientists, engineers, public health policymakers, industry actors and members of the general public with an easily accessible source of intelligence for improving the detection, prevention, and treatment of diseases such as the novel coronavirus.

"Given the drastic impact of the COVID-19 crisis on human health and welfare, the world needs easy access to every bit of information available for the successful innovation in the pursuit of vaccines, treatments and cures. Patent documents are rich sources of technological know-how acquired by humans over the centuries," said WIPO Director General Francis Gurry. "I am pleased that WIPO's new patent-searching tool helps disseminate information on technologies that others may build upon for the global fight against COVID-19."

At the time of release, the new PATENTSCOPE search facility provides dozens of search queries specially curated by patent information experts who have identified technological areas relevant to the detection, prevention and treatment of COVID-19.

PATENTSCOPE contains over 83 million patent and related documents, provides comprehensive searching of patent information with multi-lingual search capabilities and an automatic translation system that uses Artificial Intelligence (AI) technologies for highly accurate results.

Via the new COVID-19 functionality, thousands of documents deemed of potential use to innovators working on COVID-19 mitigation efforts would be returned.

- Download the result lists up to 10,000 records using the Download button above the result list. After clicking the icon, the downloading will automatically start and open an Excel sheet with either 1000 (simple icon) result or 10,000 (icon 10k).

NAVIGATION BAR

LOGIN

- Download one or more documents by selecting in the *Settings* menu, in the *Download* tab, the *enable multi document download* can be activated for logged-in users in order to download one or more documents.

- Once logged-in, users will also have access to the chemical structure search in the *Search* menu, as well as Save their preferred settings, such as the search interface by default, the length of the search result list, etc. in the *Options* menu.
- Select the *Offices* when using *Simple Search*.

ANNEX

SEARCH SYNTAX

The search syntax allows you to search for specific information in the advanced search. A query is a logical sentence that consists of elements joined by special symbols called operators used to define the relationship between words or groups of words.

An “element” can be:

- a single term (“engine”);
- a phrase (a group of words surrounded by quotes to search for multiple words in exact order: “magnetic cup”); or
- several of these grouped together with parentheses.

List of operators supported in the PATENTSCOPE search service:

Operators	Example	Explanation
BOOLEAN		always use in capital
AND	train AND plane	Returns all documents that contain both the first term and the second term.
OR	train OR plane	Returns all documents that contain either the first term or the second term or both.
NOT	NOT plane	Returns all documents that do not contain the term following NOT.
ANDNOT	train ANDNOT plane	Returns all documents that contain the first term and not the term following NOT.
WILDCARD		50 wildcards/query max 10 wildcards/individual fields (EN_ALLTXT for example)except: <ul style="list-style-type: none"> • EN_ALL, FR_ALL, DE_AL.. 3 wildcards max • FR_ALLTXT, DE_ALLTXT... 5 wildcards max 2 wildcards/phrase max (EN_TH:“elec*car*veh*”) No leading wildcard (EN_TH:“*elec”)
?	te?t	Returns all documents that contain test or text. Wildcard search uses ? to search terms with one single character replaced. It is possible to use for example 2 ? to replace 2 characters; Maximum of 3 wildcards per query for non-logged-in users and 7 for logged-in users.

(Continued on Next Page)

ANNEX

SEARCH SYNTAX

*	electr* elec*try	Returns all documents that contain electr ^{ic} , electr ^{ics} , electr ^{ical} , electr ^{icity} . Returns all documents that contain electr ^{icity} . Wildcard search uses * to search terms with 0 or more characters replaced either in the middle of the term or at the end of the term (* as the 1st character of the term is not supported). Maximum of 3 wildcards per query for non-logged-in users and 7 for logged-in users
OTHERS		
^	power^10 nuclear	Returns all documents in which “power” is considered to be more relevant (10 times in the example) than “nuclear”. The caret assigns importance values to individual query terms.
+/-	+electric-power	Returns all documents that contain electric and that do not contain power Filtered searching allows to require (+) a query term and to prohibit (-) one.
~	roo~	Fuzzy search returns all documents that contain room, roof, root, etc.
()	(spaghetti OR plate) AND fork	Returns all documents that contain spaghetti or plate and fork. Grouping is used to group clauses to form sub-queries.
~/NEAR	“heart monitoring”~10 Heart NEAR monitoring	Proximity search allows specifying a distance between words. In the example with tilde “heart” and “monitoring” are separated by 10 other words; NEAR separates words by 5 words by default
[]	[01.01.2000 TO 01.01.2001]	Returns all documents that contain dates between 01.01.2000 and 01.01.2001. Range search uses [] to include the bounds.
{ }	{Smith TO Townsend}	Returns all documents that contain names between Smith and Townsend, but not including Smith and Townsend. Range search uses { } to exclude the bounds.

ANNEX

FIELD CODES

Field codes are used in the *Advanced Search* interface to limit your search to specific fields. For example:

To search for documents that contain the terms “precipitated calcium carbonate”, “carbon dioxide”, and variants of the word inject in any English text and belong to the fields of technology of papermaking or cellulose production, as represented by the IPC subclass D21, you can use the query:

```
EN_ALLTXT:("precipitated calcium carbonate" AND "carbon dioxide" AND inject*) AND IC:D21
```

The EN_ALLTXT field code represents a combination of the English title, abstract, description, and claims fields, while the IC field code represents the International Patent Classification field. You should use parentheses (brackets) to enclose all search terms for a given field; and make sure not to put any spaces between the field code and the brackets!

List of supported field codes in the PATENTSCOPE search service:

Symbol	Name	Example
AU	Author	AU:(Smith,John)
CHEM	Chemical	CHEM:(BSYNRYMUTXBXSQ-UHFFFAOYSA-N)
CTR	Country	The entered value is searched against the originated country of the physical patent document (national/regional collections). When in doubt you should use the office field (OF) CTR:(CU or KR)
DG	Grant Date	DG:(2010) DG:(201007) DG:(20100715) DG:([01.01.2000 TO 01.01.2005])
DS	Designated States	DS:(US)
DTY	Latest Kind code	DTY:(U) DTY:(Y)
DTY_M	Latest and previous Kind codes	DTY_M:(U) DTY_M:(Y)
FR	Front Page	The entered value is searched against the Title, Abstract, Numbers and Names FP:("electric car"~50) FP:(Smith OR Klein) FP:(WO2010000001) FP:(EP2012001709) FP:("sol* panel"~5) FP:(elect?icit?) FP:(electric^10 AND car^3
